

# Ambience

## Insulating glass

The Ambience insulating glass is made up of two or more sheets separated one from the other by a sealed air chamber or another dehydrated gas (argon or krypton) that is obtained using an aluminium profile separator which includes a humidity absorber. The air tightness of the double glazing is achieved by using two barriers: firstly a butyl sealant followed by a second sealant made of polysulphur or silicon. The adhesive and elasticity properties of the second sealer guarantee the integrity of the sealing.

### Dimensions

Maximum dimensions	Minimum dimensions	Maximum thickness
5500 x 2700 mm	350 x 190 mm	60 mm

\*Consult our Technical department for other dimensions and thickness.
